

**J. Sargeant Reynolds Community College  
Course Content Summary**

**Course Prefix and Number:** MCR 4

**Credits:** 1

**Course Title:** Learning Support for Quantitative Reasoning

**Course Description:** Provides instruction for students who require minimum preparation for college-level Quantitative Reasoning. Students in this course will be co-enrolled in MTH 154. Credits are not applicable toward graduation and do not replace MTE courses waived. Successful completion of Quantitative Reasoning results in the prerequisite MTE modules being satisfied. Prerequisites: Completion of any three of the MTE modules 1-5 and co-enrollment in MTH 154. Lecture 1 hour per week.

**General Course Purpose:** To enable qualified students to enter into credit-bearing courses sooner, with the appropriate support, and with equal or better success than those students meeting course prerequisite requirements. The course provides support and enhancement of foundational and course content required of the credit course.

**Course Prerequisites and Co-requisites:**

Prerequisite: Completion of any three of the MTE modules 1-5 and co-enrollment in MTH 154

**Course Objectives:**

Upon completing the course, the student will be able to complete the following objectives of MTH 154:

1. Draw conclusions or make financial decisions using quantitative information
  - (Simple Interest)
    - Define interest and understand related terminology;
    - Develop simple interest formula;
    - Use simple interest formulas to analyze financial issues.
  - (Compound Interest)
    - Describe how compound interest differs from simple interest;
    - Explain the mechanics of the compound interest formula addressing items such as why the exponent and  $(1+r/n)$  is used;
    - Use compound interest formulas to analyze financial issues;
    - Show the difference between compound interest and simple interest using a table or graph.
  - (Borrowing)
    - Compute payments and charges associated with loans;
    - Identify the true cost of a loan by computing APR;
    - Evaluate the costs of buying items on credit;
    - Compare loans of varying lengths and interest rates.
  - (Investing)
    - Calculate the future value of an investment and analyze future value and present value of annuities (take into consideration possible changes in rate, time, and money);
    - Calculate profit from the sale of an investment;
    - Compare various investment options and understand when it is appropriate to utilize them.

2. Draw conclusions and/or make decisions based on analysis and critique of quantitative information using proportional reasoning
  - Solve real-life problems requiring interpretation and comparison of complex numeric summaries which extend beyond simple measures of center;
  - Solve real-life problems requiring interpretation and comparison of various representations of ratios (i.e., fractions, decimals, rates, and percentages);
  - Distinguish between proportional and non-proportional situations and, when appropriate, apply proportional reasoning. Recognize when proportional techniques do not apply;
  - Solve real-life problems requiring conversion of units using dimensional analysis;
  - Apply scale factors to perform indirect measurements (e.g., maps, blueprints, concentrations, dosages, and densities);
  - Order real-life data written in scientific notation. The data should include different significant digits and different magnitudes.
  
3. Use mathematical methods of analysis to understand the requirements of a problem, create an equation or program that allows prediction and interpretation of quantitative elements of the problem and solution (including limitations of each), and critique the resulting mathematical model for accuracy and validity
  - (Observation)
    - Through an examination of examples, develop an ability to study physical systems in the real world by using abstract mathematical equations or computer programs;
    - Make measurements of physical systems and relate them to the input values for functions or programs;
    - Compare the predictions of a mathematical model with actual measurements obtained;
    - Quantitatively compare linear and exponential growth;
    - Explore the mathematical and logical structures that enable familiar models encountered in daily life
      - Weather models;
      - Financial models;
      - Simple physical models;
      - Normal and exponential population models.
  - (Mathematical Modeling and Analysis)
    - Assemble measurements and data gathered (possibly through surveys, Internet, etc.) into tables, displays, charts, and simple graphs;
    - Explore interpolation and extrapolation of linear and non-linear data; determine the appropriateness of interpolation and/or extrapolation;
    - Identify and distinguish linear and non-linear data sets arrayed in graphs, identifying when a linear or non-linear model or trend is reasonable for given data or context;
    - Correctly associate a linear equation in two variables with its graph on a numerically accurate set of axes;
    - Numerically distinguish which one of a set of linear equations is modeled by a given set of (x,y) data points;
    - Identify a mathematical model's boundary values and limitations (and related values and regions where the model is undefined); identify this as the domain of an algebraic model;
    - Using measurements (or other data) gathered and a computer program (spreadsheet or GDC) to create different regressions (linear and non-linear), determine the best model, and use the model to estimate future values.

(Application)

- Starting with a verbally described requirement, generate an appropriate mathematical approach to creating a useful mathematical model for analysis;
  - Explore the graphical solutions to systems of simultaneous linear equations and their real world applications;
  - Numerically analyze and mathematically critique the utility of specific mathematical models: instructor-provided, classmate-generated, and self-generated.
4. Identify invalid and unsupported chains of reasoning, and employ methods from the mathematical disciplines of Set Theory and Logic to develop internally consistent arguments and conclusions
- Identify logical fallacies in popular culture: political speeches, advertisements, and other attempts to persuade;
  - Relate the concept of a “statement” to the notion of Truth Value; identify statements and non-statements;
  - Describe the differences between verbal expression of truth and mathematical expression of truth. Discuss the usefulness of symbolic representation of statements. Discuss the 2-valued nature of mathematical truth value and relate this to real world examples;
  - Determine the logical equivalence between two different verbal statements (simple and compound) in real world context;
  - Relate the language of conditionals to the language of quantified statements;
  - Explore the relationship between quantified statements and conditional statements (e.g., “all scientists are educated” is equivalent to “if she is a scientist, then she is educated”);
  - Apply concepts of symbolic logic and set theory to examine compound statements and apply that to decision-making of real world applications.

### **Major Topics to Be Included**

1. Financial Literacy—Interest, Borrowing, Investing
2. The Perspective Matters—Number, Ratio, and Proportional Reasoning
3. Modeling—Observation, Mathematical Modeling and Analysis, Application
4. Validity Studies—Statements, Conclusions, Validity and Bias, Logic, Set Theory

**Effective Date of Course Content Summary:** August 3, 2017
